

Sliders, aligners & co: Innovative combinations for modern orthodontics

Professor Dr Benedict Wilmes
University of Düsseldorf, Germany

COURSE ORTHO WALKER

Saturday, 15th March 2025

09:00h – 17:00h

Workspace Welle 7
Bern

www.orthowalker-kieferorthopaedie.ch

WELCOME

Thanks to their aesthetic advantages, as well as improved materials and digital planning options, aligners are frequently used today for simple treatments such as the correction of front teeth. But can aligners also be appropriate and sufficiently reliable for more difficult treatment tasks?

In relation to movements of tooth roots and other physical adjustments, they are often only useful up to a point.

In such cases, sliders can be used to perform physical tooth movements before or during aligner therapy. When these sliders are combined with (mini) implants, they also serve as anchors. In this way, regardless of compliance, highly dependable physical distalisation or mesialisation can be achieved.

Mini-implants can also be of great benefit to aligner therapy where palatal expansion is required. Tooth tilting and the risk of buccal bone fenestration can thus be avoided. Techniques of aligner placement and the coordination of the mini-implant apparatus with the aligners will be considered and discussed in detail in this course.

INFORMATION
